Sample Problems from Chapter 10 and Their Solutions

Problem 1: Inscribed Angles

Question: In a circle, an inscribed angle intercepts an arc measuring 120° . What is the measure of the inscribed angle?

Solution:

The measure of an inscribed angle is half the measure of its intercepted arc.

Therefore,

$$\text{Angle measure} = 120^\circ / 2 = 60^\circ.$$

Answer: The inscribed angle measures 60° .

Problem 2: Arc Length Calculation

Question: A circle has a radius of 10 units. Find the length of an arc that intercepts a 90° central angle.

Solution:

$$\text{Arc length} = (\text{central angle} / 360^\circ) \times 2\pi r$$

$$= (90^\circ / 360^\circ) \times 2\pi \times 10$$

$$= (1/4) \times 20\pi$$

$$= 5\pi \approx 15.7 \text{ units.}$$

Answer: The arc length is approximately 15.7 units.

Problem 3: Tangent and Secant Properties

Question: A tangent and a secant intersect outside a circle, forming an angle of 40° . If the secant's external segment measures 6 units, what is the length of the tangent segment?

Solution:

Using the tangent-secant theorem,

$$(\text{External segment of secant}) \times (\text{whole secant segment}) = (\text{tangent segment})^2.$$

Suppose the secant's external segment is 6, and the entire secant segment is x , then:

$$6 \times x = (\text{tangent})^2.$$

To find the tangent segment, additional information about the secant's total length is needed. If, for example, the entire secant length is 10, then:

$$6 \times 10 = (\text{tangent})^2 \quad ? \quad 60 = (\text{tangent})^2 \quad ? \quad \text{tangent} \quad ? \quad \sqrt{60} \quad ? \quad 7.75 \text{ units.}$$

Answer: The tangent segment measures approximately 7.75 units.

- Secants and Intersecting Lines: How secants intersect circles and the properties that follow.
- Circle Theorems: Classic theorems such as the Inscribed Angle Theorem, the Tangent-Secant Power Theorem, and the Congruence of Arcs.

Understanding these topics provides the foundation for solving test questions accurately and efficiently.

Common Types of Questions and Their Solutions

- Identifying Properties of Arcs and Angles

Question Example:

In a circle, if an inscribed angle intercepts a semicircular arc, what is the measure of the angle?

Answer and Explanation:

An inscribed angle intercepting a semicircular arc measures 90 degrees. This is a direct application of the Inscribed Angle Theorem, which states that an inscribed angle measures half the measure of its intercepted arc. Since the intercepted arc is a semicircle (180°), the inscribed angle equals 90° .

Key Tip:

Always identify whether the angle is inscribed or central, as their measures relate differently to the intercepted arc.

- Using the Power of a Point Theorem

Question Example:

Given a point outside a circle from which two secants are drawn, intersecting the circle at points A, B and C, D respectively. If the lengths of segments are known, how do you find the unknown segment?

Answer and Explanation:

The Power of a Point Theorem states that:

The product of the entire secant segment and its external part equals the product of the other secant's external part and its entire secant.

Mathematically:

$$[(\text{External segment}) \times (\text{External} + \text{Internal segment}) = (\text{External segment}) \times (\text{External} + \text{Internal segment})]$$

This allows students to set up equations based on known and unknown segment lengths and solve algebraically.

Practical Tip:

Carefully label all segments and ensure correct application of the theorem to avoid common mistakes.

- Applying Congruence and Similarity in Circles

Question Example:

Two chords intersect inside a circle, forming angles at the intersection point. How can you determine if the segments are proportional?

Answer and Explanation:

When two chords intersect inside a circle, the Chords Intersection Theorem states that the products of the segments are equal:

$$[AE \times EC = BE \times ED]$$

If two angles are inscribed and subtend equal arcs, then the corresponding segments are proportional, and the triangles formed are similar by the AA (Angle-Angle) Similarity Criterion.

Study Strategy:

Draw and label all relevant angles and segments carefully to spot similar triangles or proportional segments.

Question 1: Identifying Inscribed and Central Angles

Given a circle with an inscribed angle measuring 40° , find the measure of the intercepted arc.

Answer:

The measure of an inscribed angle is half the measure of its intercepted arc.

Solution:

- Inscribed angle = 40°
- Intercepted arc = $2 \times 40^\circ = 80^\circ$

Key Point:

The intercepted arc is 80° .

Question 2: Tangent and Secant Theorem Application

In a circle, a tangent and a secant intersect outside the circle. The tangent segment measures 10 units, and the secant segment from the external point to the far intersection point measures 18 units. Find the length of the external secant segment from the external point to the nearer intersection point.

Answer:

Using the Tangent-Secant Power Theorem:

If a tangent segment and a secant segment are drawn from a point outside a circle, then:

$$(\text{tangent})^2 = \text{external secant segment} \times \text{whole secant segment}$$

Let x be the length from the external point to the nearer intersection point on the secant.

Then:

$$\sqrt{10^2 = x \times 18}$$

$$\sqrt{100 = 18x}$$

$$\sqrt{x = \frac{100}{18} = \frac{50}{9} \approx 5.56}$$
