Sample Nelson Thornes AQA Psychology Exam Style Answer

Question:

Evaluate the cognitive explanation of depression. (8 marks)

Sample Answer:

The cognitive explanation of depression suggests that negative thought patterns and maladaptive thinking contribute to the development and maintenance of depression. This approach emphasizes the role of cognition, proposing that individuals with depression often engage in cognitive biases such as all-or-nothing thinking and catastrophizing (Beck, 1967). These distortions influence their perceptions of themselves, the world, and the future, leading to feelings of hopelessness and despair.

One strength of this explanation is its emphasis on the importance of cognition, which is supported by research evidence. For example, Beck's cognitive theory highlights how negative automatic thoughts can trigger depressive episodes, a view supported by studies showing that cognitive-behavioral therapy (CBT), which targets these thought patterns, is effective in treating depression (Hollon et al., 2002). This demonstrates that maladaptive thinking plays a significant role in depression.

However, a limitation of the cognitive explanation is that it may oversimplify depression by neglecting biological factors such as genetic predisposition or neurochemical imbalances (e.g., serotonin levels). Some individuals with depression do not exhibit prominent negative thought patterns, suggesting that other factors may also be involved. Additionally, cognitive explanations may not fully account for the onset of depression triggered by external events, such as trauma or significant loss.

In conclusion, while the cognitive explanation provides a valuable framework for understanding depression and has led to effective treatments like CBT, it is important to consider biological and environmental factors as well. A comprehensive approach that integrates cognitive, biological, and social perspectives offers a more complete understanding of depression.
