Sample Question 1: Maxima and Minima of Functions of Two Variables

Question:

Find the critical points and determine their nature for the function $f(x, y) = 3x^2 + 2xy + y^2 - 6x - 4y + 5$.

Answer:

Step 1: Find the first-order partial derivatives

$\frac{\partial f}{\partial x}$

$$= 6x + 2y - 6$$

$\frac{\partial f}{\partial y}$

$= 2x + 2y - 4$

$$= 2x + 2y - 4$$

Step 2: Set partial derivatives to zero to find critical points

\[

$$6x + 2y - 6 = 0 \quad \dots(1)$$

\]

\[

$$2x + 2y - 4 = 0 \quad \dots(2)$$

\]

Step 3: Solve the equations

From (2):

\[

$$2x + 2y = 4 \Rightarrow x + y = 2 \Rightarrow y = 2 - x$$

\]

Substitute into (1):

\[

$$6x + 2(2 - x) - 6 = 0$$

\]

\[

$$6x + 4 - 2x - 6 = 0$$

\]

\[

$$(6x - 2x) + (4 - 6) = 0$$

\]

\[

$$4x - 2 = 0$$

\]

\[

$$4x = 2 \Rightarrow x = \frac{1}{2}$$

\]

Now, find y:

\[

$$y = 2 - x = 2 - \frac{1}{2} = \frac{3}{2}$$

\]

Critical point: $(\frac{1}{2}, \frac{3}{2})$

Step 4: Second derivative test

Calculate second partial derivatives:

\[

$$f_{xx} = 6, \quad f_{yy} = 2, \quad f_{xy} = 2$$

\]

Determinant D:

\[

$$D = f_{xx} f_{yy} - (f_{xy})^2 = (6)(2) - (2)^2 = 12 - 4 = 8 > 0$$

\]

Since $(D > 0)$ and $(f_{xx} > 0)$, the critical point is a local minimum.

Sample Question 2: Solving a First-Order Differential Equation

Question:

Solve the differential equation:

$$\frac{dy}{dx} = \frac{x + y}{x}$$

given that $(y(1) = 2)$.

Answer:

Step 1: Rewrite the differential equation

$$\frac{dy}{dx} = 1 + \frac{y}{x}$$

This is a linear differential equation in the form:

$$\frac{dy}{dx} - \frac{1}{x}y = 1$$

Step 2: Find the integrating factor

$$\mu(x) = e^{-\int \frac{1}{x} dx} = e^{-\ln |x|} = \frac{1}{x}$$

Step 3: Multiply the entire equation by the integrating factor

\[

$$\frac{1}{x} \frac{dy}{dx} - \frac{1}{x^2} y = \frac{1}{x}$$

\]

Recognize the left as the derivative of $\left(\frac{y}{x} \right)$:

\[

$$\frac{d}{dx} \left(\frac{y}{x} \right) = \frac{1}{x}$$

\]

Step 4: Integrate both sides

\[

$$\frac{y}{x} = \int \frac{1}{x} dx = \ln |x| + C$$

\]

Step 5: Solve for y

\[

$$y = x (\ln |x| + C)$$

\]

Step 6: Apply the initial condition $(y(1) = 2)$

\[

$$2 = 1 (\ln 1 + C) = 0 + C \Rightarrow C = 2$$

\]

Final solution:

$$\boxed{\int_0^1 \int_0^{4-x} xy \, dy \, dx}$$

$$y = x (\ln |x| + 2)$$

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

Sample Question 3: Evaluation of a Double Integral over a Region

Question:

Evaluate the double integral:

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

where R is the region bounded by $x = 0$, $y = 0$, and $y = 4 - x$.

Answer:

Step 1: Describe the region R

- x ranges from 0 to 4 (since $y = 4 - x$ intersects $x = 0$ and $y = 0$)
- For each x , y ranges from 0 to $4 - x$

Step 2: Set up the double integral

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

$$\int_0^1 \int_0^{4-x} xy \, dy \, dx$$

Step 3: Integrate with respect to y

$$\int$$

$$\int_0^4 \left[x \frac{y^2}{2} \right]_0^{4-x} dx = \int_0^4 x \frac{(4-x)^2}{2} dx$$

$$\int$$

Step 4: Simplify and integrate with respect to x

$$\int$$

$$\frac{1}{2} \int_0^4 x (4-x)^2 dx$$

$$\int$$

Expand $(4-x)^2 = 16 - 8x + x^2$:

$$\int$$

$$\frac{1}{2} \int_0^4 x (16 - 8x + x^2) dx$$

$$\int$$

Distribute:

$$\int$$

$$\frac{1}{2} \int_0^4 (16x - 8x^2 + x^3) dx$$

$$\int$$

Integrate term by term:

$$\int$$

$$\frac{1}{2} \left[8x^2 - \frac{8}{3} x^3 + \frac{1}{4} x^4 \right]_0^4$$

Diploma Mathematics 2 Solved Question with Answer

Mathematics forms the backbone of engineering and technical education, especially at the diploma level where foundational concepts are established to prepare students for advanced applications. Among the core courses, Diploma Mathematics 2 typically covers advanced calculus, differential

equations, matrices, and vector calculus, serving as a bridge between theoretical understanding and practical problem-solving. Providing solved questions with detailed explanations is an effective pedagogical approach, enabling students to grasp complex concepts, develop problem-solving skills, and build confidence for examinations and real-world applications.

This article aims to delve into a comprehensive, well-explained solved question from Diploma Mathematics 2, illustrating the systematic approach required to analyze and solve advanced problems. The discussion will cover the problem statement, the underlying principles, step-by-step solutions, and a detailed explanation of each step, accompanied by relevant formulas and concepts. Such an analytical review not only aids in understanding specific questions but also reinforces the underlying mathematical techniques essential for succeeding in diploma-level mathematics courses.

Understanding the Context of Diploma Mathematics 2

Diploma Mathematics 2 typically encompasses a spectrum of advanced mathematical topics that are crucial for engineering and technical disciplines. These include:

- Calculus of Several Variables: Partial derivatives, multiple integrals, and applications.
- Differential Equations: Solutions of ordinary differential equations (ODEs) and their applications.
- Matrices and Determinants: Eigenvalues, eigenvectors, and their applications in systems of equations.
- Vector Calculus: Gradient, divergence, curl, line, surface, and volume integrals.
- Transform Methods: Laplace and Fourier transforms for solving differential equations.

Understanding these topics provides the groundwork for solving complex problems that often appear in exams, project work, and practical scenarios. The focus of this article is to analyze a typical problem involving differential equations, a core component of Diploma Mathematics 2, illustrating the approach required to arrive at solutions systematically.

Sample Problem: Solving a Second-Order Differential Equation

Problem Statement

Solve the second-order linear differential equation:

\[

$$\frac{d^2 y}{dx^2} - 3 \frac{dy}{dx} + 2 y = 0$$

\]

with initial conditions:

\[

$$y(0) = 4, \quad y'(0) = 0$$

\]

Determine the general solution, apply the initial conditions, and find the particular solution.

Step-by-Step Solution Approach

1. Recognize the Type of Differential Equation

The given equation is a homogeneous linear second-order differential equation with constant coefficients:

\[

$$\frac{d^2 y}{dx^2} - 3 \frac{dy}{dx} + 2 y = 0$$

\]

The standard method for such equations involves solving the characteristic (auxiliary) equation derived from the differential equation.

2. Formulate the Characteristic Equation

Assume a solution of the form $y = e^{mx}$, where m is a constant to be determined. Substituting into the differential equation:

\[

$$m^2 e^{mx} - 3 m e^{mx} + 2 e^{mx} = 0$$

\]

Dividing through by e^{mx} (which is never zero):

\[

$$m^2 - 3m + 2 = 0$$

\]

This quadratic equation is the characteristic equation.

3. Solve the Characteristic Equation

Solve:

\[

$$m^2 - 3m + 2 = 0$$

\]

Factor or use quadratic formula:

\[

$$(m - 1)(m - 2) = 0$$

\]

Thus,

\[

$$m_1 = 1, \quad m_2 = 2$$

\]

Since roots are real and distinct, the general solution of the differential equation is:

\[

$$y(x) = C_1 e^{m_1 x} + C_2 e^{m_2 x} = C_1 e^x + C_2 e^{2x}$$

\]

where (C_1) and (C_2) are constants to be determined.

4. Apply Initial Conditions to Find Constants

Given:

[

$$y(0) = 4, \quad y'(0) = 0$$

]

Compute $y(0)$:

[

$$y(0) = C_1 e^0 + C_2 e^0 = C_1 + C_2 = 4$$

]

Next, compute $y'(x)$:

[

$$y'(x) = C_1 e^x + 2 C_2 e^{2x}$$

]

Apply the initial condition $y'(0) = 0$:

[

$$C_1 e^0 + 2 C_2 e^0 = C_1 + 2 C_2 = 0$$

]

Now, we have a system of two equations:

[

$\begin{cases}$

$$C_1 + C_2 = 4 \quad \backslash \backslash$$

$$C_1 + 2 C_2 = 0$$

\end{cases}

\]

Subtract the first from the second:

\[

$$(C_1 + 2 C_2) - (C_1 + C_2) = 0 - 4$$

\]

\[

$$C_2 = -4$$

\]

Substitute \((C_2 = -4)\) into the first equation:

\[

$$C_1 - 4 = 4 \Rightarrow C_1 = 8$$

\]

5. Write the Particular Solution

Plugging the constants back into the general solution:

\[

\boxed{\

$$y(x) = 8 e^{\{x\}} - 4 e^{\{2x\}}$$

\}

\]

This is the particular solution satisfying the initial conditions.

Analytical Insights and Significance

This example underscores several key principles in solving differential equations at the diploma level:

- Characteristic Equation Method: The cornerstone for solving linear differential equations with constant coefficients. Recognizing the form and deriving the characteristic equation simplifies the process.
- Initial Conditions Application: Essential for determining the arbitrary constants in the general solution, transforming it into a particular solution relevant to specific problems.
- Exponential Solutions: The roots of the characteristic equation directly inform the form of the solution, especially whether solutions involve exponentials, sines, cosines, or polynomials.

Understanding these principles is fundamental for students, as they frequently face such equations in engineering contexts?modeling systems, electrical circuits, mechanical vibrations, and thermal processes.

Extensions and Practical Relevance

While the solved question exemplifies a straightforward case, real-world problems often involve:

- Non-homogeneous differential equations with forcing functions.
- Variable coefficient equations requiring special functions.
- Systems of differential equations.
- Applications involving boundary and initial conditions reflecting physical constraints.

The method demonstrated here extends to these more complex scenarios, with modifications like the method of undetermined coefficients, variation of parameters, or Laplace transforms?techniques that are also covered in Diploma Mathematics 2.

In practical engineering, such solutions help analyze system behaviors, predict responses over time, and design control systems. For instance, mechanical oscillations modeled by second-order differential equations can be analyzed for stability, damping, and resonance?crucial in designing safe and efficient machinery.

Conclusion

The solved question on a second-order linear differential equation encapsulates the essential problem-solving approach in Diploma Mathematics 2. Through recognizing the type of equation, deriving the characteristic roots, and applying initial conditions, students can systematically arrive at solutions that are both mathematically rigorous and practically meaningful.

Mastering such problems not only prepares students for examinations but also equips them with analytical tools vital for their engineering careers. The clarity of step-by-step solutions, as demonstrated here, promotes a deeper understanding of core mathematical concepts and their applications in complex, real-world systems.

As diploma courses evolve, the fundamental techniques illustrated in this example continue to serve as a foundation for more advanced topics, emphasizing the importance of solid mathematical grounding in engineering education.

Sample Questions from EAS 203 Engineering Mathematics 2 Solved Paper

Question 1: Solve the Differential Equation $\left(\frac{dy}{dx} + y \tan x = \sin^2 x \right)$

Solution:

Step 1: Recognize as a first-order linear ODE.

Step 2: Write in standard form:

$$\left[\frac{dy}{dx} + P(x) y = Q(x) \right]$$

where $\left(P(x) = \tan x \right)$, $\left(Q(x) = \sin^2 x \right)$.

Step 3: Find integrating factor:

$$\left[\mu(x) = e^{\int P(x) dx} = e^{\int \tan x dx} = e^{-\ln |\cos x|} = \frac{1}{\cos x} \right]$$

Step 4: Multiply entire equation by $\left(\mu(x) \right)$:

$$\left[\frac{1}{\cos x} \frac{dy}{dx} + \frac{\tan x}{\cos x} y = \frac{\sin^2 x}{\cos x} \right]$$

which simplifies to:

$$\left[\frac{d}{dx} \left(\frac{y}{\cos x} \right) = \frac{\sin^2 x}{\cos x} \right]$$

Step 5: Integrate both sides:

$$\left[\frac{y}{\cos x} = \int \frac{\sin^2 x}{\cos x} dx + C \right]$$

Using $\left(\sin^2 x = 1 - \cos^2 x \right)$:

$$\int \frac{1 - \cos^2 x}{\cos x} dx = \int \frac{1}{\cos x} dx - \int \cos x dx$$

$$= \int \sec x dx - \int \cos x dx$$

$$= \ln |\sec x + \tan x| - \sin x + C$$

Thus:

$$y = \cos x (\ln |\sec x + \tan x| - \sin x + C)$$

This is the general solution.
