Grounding Strategy

Proper grounding is essential in Aeroelectric designs to prevent ground loops and voltage differentials that can cause erratic operation. For the KX 125:

- A single, well-defined grounding bus is established.
- All ground wires are connected to this bus at a common point.
- Grounding points are chosen away from high-current loads.
- Shielded wiring is connected to ground at only one end, reducing noise.

This meticulous grounding scheme ensures stable operation of sensitive electronics like the ignition and sensors.

Component Redundancy and Safety Features

Aeroelectric systems often incorporate redundancy and safety features such as:

- Fuses and circuit breakers at strategic points to prevent damage.
- Relays and contactors to handle high-current loads without passing through switches directly.

- Emergency shut-off switches wired into the main circuit.

Implementing these features in the KX 125's wiring enhances safety and reliability, especially for high-performance or long-distance riding.
