What is Time Sweep in DIgSILENT?

Definition and Purpose

Time sweep in DIgSILENT refers to the process of running multiple simulations sequentially, each with different initial conditions, parameters, or time settings, to analyze how the power system behaves over an extended period. This technique allows engineers to observe transient phenomena, system stability, and dynamic responses under varying conditions.

The main purpose of a time sweep is to:

- Study the evolution of system variables over time
- Assess system stability margins
- Identify potential oscillations or instability issues
- Validate control strategies and protection schemes
- Perform sensitivity analyses under different scenarios

Difference Between Time Sweep and Other Simulation Types

While DIgSILENT offers various simulation modes such as steady-state, dynamic, and harmonic analyses, the time sweep specifically focuses on dynamic simulations over multiple time points or scenarios. Unlike a single dynamic simulation, a time sweep automates the process of running

numerous simulations, making it efficient for comprehensive studies.

Applications of Time Sweep in Power System Analysis

1. Transient Stability Analysis

Time sweep is crucial for transient stability studies, where the goal is to determine if the system can return to a stable operating point after disturbances like faults or switching events. By sweeping over different fault durations, locations, or system configurations, engineers can evaluate the robustness of the system.

2. Control System Testing

Testing the effectiveness of control schemes, such as governor controls, automatic voltage regulators, or power system stabilizers, requires analyzing their response over time. Time sweep allows for simulation of various control parameters to optimize settings.

3. Load and Generation Variation Studies

Power systems are subject to fluctuating loads and renewable generation variability. Time sweep can help model these changes over days, weeks, or months, providing insights into system resilience and operational limits.

4. Protection Scheme Validation

Protection devices rely on specific time settings. Running time sweep simulations ensures that protection schemes operate correctly under different scenarios, avoiding false trips or missed detections.
