The Principles Behind Design Patterns

Readers learn about fundamental principles such as:

- Encapsulation
- Abstraction
- Separation of concerns
- Code reuse

Understanding these principles lays the foundation for effective pattern implementation.

The Classification of Design Patterns

Design patterns are categorized into three groups:

- **Creational Patterns** ? Deal with object creation mechanisms
- **Structural Patterns** ? Ease the design by identifying a simple way to realize relationships among entities
- **Behavioral Patterns** ? Focus on communication between objects

Key Design Patterns Explored in the Book

Creational Patterns

These patterns help manage object creation mechanisms, making systems more flexible and dynamic.

- **Singleton**: Ensures a class has only one instance and provides a global point of access to it.
- **Factory Method**: Defines an interface for creating an object but allows subclasses to alter the type of objects that will be created.
- **Abstract Factory**: Provides an interface for creating families of related or dependent objects without specifying their concrete classes.
- **Builder**: Separates the construction of a complex object from its representation, allowing the same construction process to create different representations.
- **Prototype**: Creates new objects by copying existing ones, facilitating object cloning.

Structural Patterns

These patterns help compose objects into larger structures while keeping them flexible.

- **Adapter**: Converts the interface of a class into another interface clients expect.
- **Decorator**: Adds responsibilities to objects dynamically.
- **Facade**: Provides a simplified interface to a complex subsystem.
- **Composite**: Composes objects into tree structures to represent part-whole hierarchies.

Behavioral Patterns

Focus on communication between objects, managing algorithms, and assigning responsibilities.

- **Observer**: Defines a one-to-many dependency between objects so that when one changes state, all dependents are notified.
- **Strategy**: Defines a family of algorithms, encapsulates each one, and makes them interchangeable.
- **Command**: Encapsulates a request as an object, allowing for parameterization and queuing.
- **State**: Alters an object's behavior when its internal state changes.
- **Template Method**: Defines the skeleton of an algorithm in a base class, deferring some steps to subclasses.
