Popular Shakuntala Devi Puzzles and Brain Teasers

Shakuntala Devi's puzzles often involve patterns, sequences, and mental tricks. Here are some of her most famous puzzles:

Number Pattern Puzzles

These puzzles involve recognizing patterns and predicting subsequent numbers.

Example 1:

What is the next number in the sequence: 1, 11, 21, 1211, 111221, ...?

Answer:

The sequence is the "look-and-say" sequence. The next term after 111221 is 312211.

Explanation:

- 1 (one 1)
- 11 (two 1s)
- 21 (one 2, one 1)
- 1211 (one 1, one 2, two 1s)
- 111221 (one 1, one 1, two 2s, one 1)

Arithmetic and Number Tricks

These puzzles often involve clever calculations or mental tricks to arrive at the answer quickly.

Example 2:

Multiply 111 by 111 without using a calculator.

Solution:

$$111 \times 111 = 12,321$$

Method:

- Recognize that $111 \times 111 = (100 + 10 + 1)^2$
- Expanding: $100^2 + 210010 + 10^2 + 21001 + 2101 + 1^2$

- Or simply remember the pattern: $111 \times 111 = 12,321$.

Logical Reasoning Puzzles

These puzzles test reasoning and deduction skills.

Example 3:

There are five houses in a row painted in different colors. In each house lives a person of a different nationality. Each person drinks a different beverage, smokes a different brand of cigarette, and keeps a different pet. Given clues, determine who owns the fish.

Clues:

- The Brit lives in the red house.
- The Swede keeps dogs.
- The Dane drinks tea.
- The green house is on the left of the white house.
- The green house owner drinks coffee.
- The person who smokes Pall Mall rears birds.
- The owner of the yellow house smokes Dunhill.
- The man living in the center house drinks milk.
- The Norwegian lives in the first house.
- The man who smokes Blends lives next to the one who keeps cats.
- The man who keeps horses lives next to the one who smokes Dunhill.
- The owner who smokes BlueMaster drinks beer.
- The German smokes Prince.
- The Norwegian lives next to the blue house.
- The man who smokes Blends has a neighbor who drinks water.

- Try 360: $3 + 6 + 0 = 9$
- Try 540: $\text{sum} = 5 + 4 + 0 = 9$
- Try 720: $\text{sum} = 7 + 2 + 0 = 9$
- Try 900: $\text{sum} = 9 + 0 + 0 = 9$
- Try 1080: $1 + 0 + 8 + 0 = 9$
- Try 1260: $1 + 2 + 6 + 0 = 9$
- Try 1440: $1 + 4 + 4 + 0 = 9$
- Continue with larger multiples: 1980: $1 + 9 + 8 + 0 = 18$

Answer: 1980 is divisible by 3, 4, and 5, and its digits sum to 18.

Basic Geometry Puzzles with Answers

1. The Missing Angle Puzzle

In a triangle, two angles measure 35° and 65° . What is the measure of the third angle?

Answer:

The sum of angles in a triangle is always 180° . Therefore, the third angle is:

$$\text{- Third angle} = 180^\circ - (35^\circ + 65^\circ) = 180^\circ - 100^\circ = 80^\circ$$

Explanation:

Understanding the basic property that all triangles have interior angles summing to 180° is fundamental. This puzzle reinforces the importance of this rule and helps in quick calculations when two angles are known.

2. The Isosceles Triangle Puzzle

In an isosceles triangle, the two equal angles each measure 50° . What is the measure of the third angle?

Answer:

- Since two angles are equal, their sum is $50^\circ + 50^\circ = 100^\circ$
- The third angle = $180^\circ - 100^\circ = 80^\circ$

Explanation:

This puzzle highlights properties of isosceles triangles, where two sides and their opposite angles are equal, emphasizing the symmetry and angle sum properties.

3. The Circle and Chord Puzzle

A circle has a diameter of 10 cm. Two points are marked on the circle such that they form a chord of length 8 cm. What is the measure of the angle subtended by this chord at the center of the circle?

Answer:

The angle subtended at the center by a chord is given by:

- Using the Law of Cosines or the geometric property, the central angle = $2 \times \arcsin(\text{chord length} / (2 \times \text{radius}))$
- Radius = diameter / 2 = 10 cm / 2 = 5 cm
- Central angle = $2 \times \arcsin(8 / (2 \times 5)) = 2 \times \arcsin(8 / 10) = 2 \times \arcsin(0.8)$

Using a calculator:

$$\arcsin(0.8) \approx 53.13^\circ$$

Therefore:

$$\text{Central angle} \approx 2 \times 53.13^\circ \approx 106.26^\circ$$

Explanation:

This puzzle introduces the relationship between chords, radii, and central angles in circles, illustrating how trigonometry applies in geometric contexts.

5. The Inscribed Quadrilateral Puzzle

In a circle, a quadrilateral is inscribed such that two of its opposite angles measure 70° and 110° . What are the measures of the other two angles?

Answer:

Key principle:

Opposite angles in a cyclic quadrilateral sum to 180° .

- Given: 70° and 110° are opposite angles, so their sum is 180° , satisfying the cyclic quadrilateral property.

- The other two angles are supplementary to the given angles in pairs, meaning:

- Remaining angles = $180^\circ - 70^\circ = 110^\circ$ and $180^\circ - 110^\circ = 70^\circ$

Thus, the other two angles are 110° and 70° respectively.

Explanation:

This problem emphasizes properties of cyclic quadrilaterals, where opposite angles are supplementary, reinforcing circle and angle relationships.

6. The Equilateral Triangle Puzzle

A square has a side length of 12 cm. Inside it, an equilateral triangle is inscribed such that its vertices touch three sides of the square. What is the side length of the inscribed equilateral triangle?

Answer:

The side length of the inscribed equilateral triangle is approximately 8.49 cm.

Calculation:

- Place the square on a coordinate plane for clarity, with vertices at (0,0), (12,0), (12,12), (0,12).

- The inscribed equilateral triangle touches three sides, typically at points dividing the sides into segments.

- The most common configuration is with the triangle inscribed such that its vertices lie on three sides of the square, forming a smaller equilateral triangle inside.

- Using geometric relationships and coordinate geometry, the side length s can be approximated by:

$$s = (\text{side of square}) \times (\sqrt{3} - 1) / \sqrt{2} \approx 12 \times (1.732 - 1) / 1.414 \approx 12 \times 0.732 / 1.414 \approx 8.49 \text{ cm}$$

Explanation:

This problem combines coordinate geometry with properties of equilateral triangles, illustrating how geometric figures can be inscribed within squares.

7. The Tangent and Radius Puzzle

A circle has a radius of 7 cm. A point outside the circle is 15 cm from the center. How long are the two tangent segments from this point to the circle?

Answer:

- The length of each tangent segment = $\sqrt{(\text{distance from point to center}^2 - \text{radius}^2)}$
- Length = $\sqrt{(15^2 - 7^2)} = \sqrt{(225 - 49)} = \sqrt{176} \approx 13.27$ cm

Explanation:

This classic problem involves the tangent-secant theorem, illustrating the relationship between the external point, the circle's radius, and the tangent segments.

8. The Square and Diagonal Puzzle

A square has a side length of 9 cm. What is the length of its diagonal?

Answer:

- Using the Pythagorean theorem: diagonal = $\sqrt{(9^2 + 9^2)} = \sqrt{(81 + 81)} = \sqrt{162} \approx 12.73$ cm

Explanation:

This straightforward problem emphasizes the relationship between the side length and diagonal in a square, reinforcing Pythagoras' theorem.

Popular Geometry Puzzles with Answers

Let's explore some classic and intriguing puzzles from each category, complete with detailed solutions.

1. The Isosceles Triangle Puzzle

Puzzle:

In an isosceles triangle ABC, where $AB = AC$, the base BC is extended beyond C to point D. If the angle at A is 40° , and the angle at D is 70° , what is the measure of angle ABC?

Solution:

Step 1: Understand the given information.

- Triangle ABC is isosceles with $AB = AC$.
- $\angle A = 40^\circ$.
- D is on the extension of BC beyond C, with $\angle D = 70^\circ$.

Step 2: Find $\angle ABC$.

Because $AB = AC$, $\angle ABC = \angle ACB$. Let's denote each as x .

Step 3: Use the triangle angle sum.

In triangle ABC:

$$\angle A + 2x = 180^\circ$$

$$\angle 40^\circ + 2x = 180^\circ$$

$$\angle 2x = 140^\circ$$

$$\angle x = 70^\circ.$$

Step 4: Find $\angle ACB$.

$$\angle ACB = 70^\circ.$$

Step 5: Find the exterior angle at C (angle D).

Since D is on the extension of BC beyond C, $\angle D$ is an exterior angle to triangle ABC at C.

- The exterior angle at C is equal to the sum of the opposite interior angles:

$$\angle D = \angle A + \angle B = 40^\circ + 70^\circ = 110^\circ.$$

Step 6: Compare with given $\angle D$.

But the puzzle states $\angle D = 70^\circ$, which conflicts with our calculation.

Correction:

This indicates an inconsistency; the original problem likely expects the use of alternate angles or other properties.

Alternative Approach:

Given the angles, perhaps the key is recognizing that the angle between the extended side and the triangle's interior.

Answer:

Given the problem's constraints, the measure of $\angle ABC$ is 70° .

2. The Circle and Inscribed Triangle Puzzle

Puzzle:

A triangle inscribed in a circle has angles of 50° and 60° . What is the measure of the third angle?

(Hint: Use properties of inscribed angles)

Solution:

Step 1: Recall the property:

An inscribed angle measures half of the intercepted arc.

Step 2: Understand that the sum of angles in a triangle is 180° .

Since two angles are given: 50° and 60° , the third angle is:

$$180^\circ - 50^\circ - 60^\circ = 70^\circ.$$

Step 3: Check consistency with circle properties.

- The inscribed angles correspond to arcs:

50° angle intercepts an arc of 100° , because inscribed angle = half of intercepted arc.

- Similarly, the 60° angle intercepts a 120° arc.

Step 4: Confirm the third angle.

- The remaining arc would be 180° , consistent with the total circle being 360° .

Answer:

The third inscribed angle measures 70° .

3. The Square and Diagonals Puzzle

Puzzle:

In a square ABCD, the diagonals intersect at point O. What is the measure of the angles formed between the diagonals at point O?

Solution:

Step 1: Recall properties of a square.

- Diagonals are equal in length and bisect each other at 90° angles.

Step 2: Relationship of diagonals.

- The diagonals of a square are perpendicular and bisect each other.

Step 3: Find angles between diagonals at O.

- Since the diagonals intersect at 90° , the angles formed are four right angles at the intersection point.

Answer:

Each angle between the diagonals at point O measures 90° .

Advanced Geometry Puzzles

For those seeking more challenging problems, advanced puzzles often involve multiple properties and theorems such as the Pythagorean theorem, similarity, congruence, and circle theorems.

Example: The Equilateral Triangle Puzzle

Puzzle:

An equilateral triangle has side length 6 units. A point P is chosen inside the triangle such that the distances from P to the vertices are 3, 4, and 5 units respectively. Is such a point P possible? Why or why not?

Solution:

This problem involves the "triangle inequality" and properties of points inside triangles.

- For point P with distances to vertices A, B, and C as 3, 4, and 5 units respectively, the sum of any two distances must be greater than the third (triangle inequality).

Check sums:

- $3 + 4 = 7 > 5$ (OK)

- $4 + 5 = 9 > 3$ (OK)

- $3 + 5 = 8 > 4$ (OK)

These satisfy the triangle inequality. However, whether such a point exists inside the equilateral triangle requires more advanced geometric construction or coordinate geometry.

Conclusion:

Yes, such a point can exist based on the triangle inequality, but its exact position depends on the

specific geometry and may require coordinate calculations to verify.

Tips for Solving Geometry Puzzles

- Visualize the problem: Draw accurate diagrams. Use tools like compass and ruler when necessary.
- Recall key theorems: Such as the properties of triangles, circle theorems, and properties of polygons.
- Look for symmetries: Symmetry often simplifies complex problems.
- Break down the problem: Divide complex figures into simpler components.
- Use algebraic methods: Coordinates, vectors, or algebraic equations can provide clarity.
- Verify your solution: Check if your answer aligns with the given constraints.

Conclusion

Geometry puzzles with answers serve as a delightful and powerful way to explore mathematical concepts and sharpen reasoning skills. From classic triangle and circle problems to more sophisticated spatial challenges, these puzzles not only entertain but also deepen understanding of the geometric principles that underpin the physical and mathematical world. Whether you enjoy solving puzzles for fun, use them for educational purposes, or seek to prepare for competitions, engaging with a wide variety of problems can significantly enhance your geometric intuition and problem-solving prowess. Keep practicing, stay curious, and enjoy the fascinating world of geometry puzzles!

These puzzles combine the classic allure of magic squares with the challenge of developing a strong vocabulary, creating an educational tool that is both entertaining and instructive. In this article, we delve into the concept of keystone vocabulary magic squares, explore common solutions, strategies for solving them, and how they can be utilized for effective learning.

What Is a Keystone Vocabulary Magic Square?

Definition and Basic Structure

A keystone vocabulary magic square is a type of puzzle that arranges words or vocabulary terms within a square grid. The goal is to position these words so that each row, each column, and sometimes the diagonals, collectively satisfy specific criteria?most often that the words are related in meaning, share a common root, or sum to a particular value based on letter values.

Key Features

- Grid Size: Typically 3x3 or 4x4, but larger grids are also possible.
- Vocabulary Focus: The words are usually thematically linked (e.g., synonyms, antonyms, root words).
- Magic Property: The sum of certain values (like letter counts, letter point values based on Scrabble scores, or alphabetical positions) matches across rows, columns, and diagonals.
- Educational Purpose: To reinforce vocabulary, spelling, and word recognition.

Common Types of Keystone Vocabulary Magic Squares

- Letter-Value Based Squares

These use numerical values assigned to letters (e.g., A=1, B=2, ..., Z=26). The puzzle requires that the sum of each row, column, or diagonal equals a target number.

- Thematic Vocabulary Squares

Words are selected based on a theme?such as "synonyms for 'happy'"?and arranged so that each row or column contains related words, or the total number of letters adds up to a specific number.

- Root Word Squares

These focus on vocabulary rooted in common morphemes. For example, words sharing the root "spect" (spectator, inspect, spectacle) are arranged to demonstrate their relations.

Strategies for Solving Keystone Vocabulary Magic Squares

Understanding the Clues and Constraints

- Carefully analyze the theme or instructions.
- Identify the total sum or pattern required for each row, column, or diagonal.
- List potential words that fit the theme and length constraints.

Breaking Down the Puzzle

- Begin with the most constrained element?such as a row or column with the fewest options.
- Use process of elimination to narrow down possible word placements.

Utilizing Word Lists and Tools

- Maintain a list of vocabulary words related to the theme.
- Use online word lists, dictionaries, or word generators to find suitable candidates.
- For letter-value puzzles, calculate sums to match target totals.

Cross-Checking and Validation

- After placing initial words, verify that all rows and columns meet the puzzle's criteria.

- Adjust placements if sums or thematic consistency are not maintained.

Examples of Keystone Vocabulary Magic Square Answers

Example 1: 3x3 Letter-Value Magic Square

Suppose the puzzle requires placing nine words where the sum of their letter values in each row, column, and diagonal equals 100.

Possible solution:

| WORD | | |

|-----|-----|-----|

| BEE | | |

| ACE | | |

| DOG | | |

(Actual words and their letter sums would be calculated to meet the target sum. The example illustrates the approach rather than a specific solution.)

Example 2: Thematic Vocabulary Square

Theme: Words related to "light."

Solution:

| GLOW | BRIGHT | LUMEN |

|-----|-----|-----|

| RAY | BEAM | FLASH |

| SHINE | GLEAM | GLOW |

In this case, each row and column contains synonyms or related words, illustrating thematic consistency.

Keystone Vocabulary Magic Square Puzzle Answers: Unlocking the Secrets of Word-Based Math Mysteries

In the world of brain teasers and cognitive challenges, the keystone vocabulary magic square puzzle answers stand out as a fascinating fusion of language mastery and mathematical logic. These puzzles are not just casual pastimes; they are intricate exercises designed to sharpen vocabulary, improve pattern recognition, and enhance problem-solving skills. As educators and puzzle enthusiasts alike dive into these intriguing challenges, understanding their structure, strategies for solving, and common pitfalls becomes essential. This article explores the depths of keystone vocabulary magic square puzzles, providing a comprehensive guide to deciphering their answers and unlocking their full potential.

What Are Keystone Vocabulary Magic Square Puzzles?

Defining the Concept

A keystone vocabulary magic square puzzle is a type of puzzle where words are arranged in a square grid – typically 3x3 or 4x4 – with the goal of achieving a specific pattern or sum across rows, columns, and diagonals. Unlike traditional number-based magic squares, these puzzles use words, often with thematic or linguistic connections, as the fundamental elements.

The term “keystone” suggests that certain words or clues act as pivotal points – the “keystones” – around which the entire puzzle revolves. The vocabulary aspect emphasizes that understanding the meanings, synonyms, or related word structures is critical for solving the puzzle.

The Intersection of Language and Math

These puzzles blend linguistic skills with mathematical logic. While they may not involve arithmetic calculations explicitly, they require recognizing patterns, relationships, and sometimes numerical values assigned to words (such as letter counts, Scrabble scores, or alphabetic positions). This hybrid nature makes them both challenging and enriching.

For example, a 3x3 keystone vocabulary magic square might require that the sum of letter values in each row, column, and diagonal be equal, with the words themselves fitting a thematic or semantic pattern.

Structure and Components of Keystone Vocabulary Magic Squares

Typical Layout

- Grid Size: Ranges from 3x3 to 4x4, with larger puzzles existing for more advanced solvers.
- Words or Clues: Each cell contains a word or a clue pointing toward a word.
- Pattern Goals: Achieving equal sums, matching themes, or satisfying specific linguistic criteria

across rows, columns, and diagonals.

Types of Patterns

- Sum-Based Patterns: Assign numerical values to words (e.g., letter counts, Scrabble scores) and aim for equal totals.
- Semantic Patterns: Ensure words in each row, column, or diagonal share a common theme, prefix, suffix, or semantic property.
- Letter Patterns: Focus on letter arrangements, such as anagrams, palindromes, or shared starting/ending letters.
- Hybrid Patterns: Combine multiple criteria, such as an equal sum of letter values and thematic coherence.

Strategies for Solving Keystone Vocabulary Magic Square Puzzles

Understanding the structure is only half the battle. Solving these puzzles requires strategic thinking, linguistic insight, and sometimes a bit of trial and error. Here are key strategies:

- Analyze Clues and Patterns Carefully
 - Identify the Pattern Type: Determine whether the puzzle emphasizes sum, theme, or letter arrangements.
 - Look for Pivotal Words: Recognize "keystone" words that serve as anchors for the entire grid.
 - Check for Repeated Elements: Repetition of prefixes, suffixes, or similar letter patterns can give clues.
- Assign Numerical Values Thoughtfully
 - Letter Values: Use the alphabetic positions (A=1, B=2, ..., Z=26).
 - Scoring Systems: If the puzzle uses Scrabble values or other scoring, familiarize yourself with those metrics.
 - Calculate and Cross-Check: Sum the values for rows, columns, and diagonals to identify potential matches.
- Use Process of Elimination

- Narrow Down Word Choices: Based on the pattern, eliminate words that do not fit the criteria.
- Test Hypotheses: Try placing a candidate word in one position and see if it leads to a consistent solution elsewhere.

- Recognize Thematic Connections

- Many puzzles revolve around a theme, such as animals, emotions, or scientific terms. Recognizing this can drastically reduce options.

- Leverage Symmetry and Positioning

- Symmetrical arrangements or certain positions may be constrained by the pattern, providing hints for placement.

Examples of Common Types of Keystone Vocabulary Magic Square Puzzles

Example 1: Numeric Sum Pattern

Imagine a 3x3 grid where each cell contains a word. The goal is to assign each word a numerical value based on letter positions, with the sums across all rows, columns, and diagonals equal. For instance, the words "CAT," "DOG," "BAT," "RAT," "FAN," "PEN," "SUN," "MOON," "STAR" could be arranged such that their letter sums align.

Solution approach:

- Calculate letter sum for each word.
- Arrange words so that sums align correctly.
- Adjust placements based on the sums and thematic coherence.

Example 2: Thematic Vocabulary Pattern

A 4x4 grid might involve words related to science. The solution involves placing words like "ATOM," "NEUTRON," "ELECTRON," "PROTON," ensuring that each row or column contains related scientific terms, perhaps with shared prefixes or suffixes.

Solution approach:

- Recognize the theme.
- Group related words.
- Position words to satisfy pattern constraints.

Common Challenges and How to Overcome Them

Challenge 1: Ambiguous Clues

Sometimes clues are vague, or multiple words fit the criteria. To mitigate:

- Use contextual clues.
- Cross-reference with thematic hints.
- Test multiple options systematically.

Challenge 2: Complex Patterns

Multi-layered patterns can be daunting. To approach:

- Break down the pattern into manageable parts.
- Focus on one pattern (e.g., sum) first, then layer in others.

Challenge 3: Time-Consuming Guesswork

While some trial is inevitable, excessive guessing can be inefficient. To improve:

- Employ logical elimination.
- Use pencil marks or notes.
- Keep track of previous attempts and their outcomes.

Unlocking the Answers: Resources and Tips

- Reference Lists

Maintain lists of themed words, synonyms, and common vocabulary to expedite solving.

- Puzzle Databases

Online repositories and puzzle collections often feature similar puzzles with solutions.

- Vocabulary Building

Enhance vocabulary knowledge to recognize patterns faster and identify suitable words.

- Software Tools

Leverage word puzzle solvers or custom scripts that can calculate letter sums and suggest options.

The Educational and Cognitive Benefits

Engaging with keystone vocabulary magic square puzzles is not merely recreational; it offers numerous cognitive advantages:

- Vocabulary Expansion: Exposure to diverse words and their meanings.
- Pattern Recognition Skills: Training the brain to see connections across linguistic and numeric domains.

Top Brilliant Maths Puzzles for Ages 10-11

Let's explore some engaging puzzles that can challenge and delight young learners.

- The Magic Square Challenge

Puzzle: Fill in the 3x3 grid with the numbers 1 through 9 so that each row, column, and diagonal sums to the same total.

Example:

|||

|---|---|---|

|||

|||

Solution Tips:

- Recognize that the magic sum for a 3x3 with numbers 1-9 is 15.
- Use known configurations or trial and error to find the arrangement.

Educational Focus:

- Understanding the concept of magic squares.
- Developing logical placement skills.

- The Age Puzzle

Puzzle: Sarah is three times as old as her brother. In five years, she will be twice as old as her brother. How old are they now?

Solution:

- Let the brother's age be B .
- Sarah's age = $3B$.
- In five years:
- Sarah: $3B + 5$
- Brother: $B + 5$
- Equation: $3B + 5 = 2(B + 5)$
- Solve for B :
- $3B + 5 = 2B + 10$
- $3B - 2B = 10 - 5$
- $B = 5$
- Sarah's age = $3 \times 5 = 15$

Answer: Sarah is 15, and her brother is 5.

Educational Focus:

- Formulating algebraic equations based on word problems.
- Applying proportional reasoning.

- The Coin Puzzle

Puzzle: You have a collection of coins totaling 30 pence. The coins are either 1p, 2p, or 5p. How many of each coin do you have?

Solution Approach:

- Let's denote:
- x = number of 1p coins
- y = number of 2p coins
- z = number of 5p coins
- Equation: $x + 2y + 5z = 30$
- Additional assumptions or constraints may be needed (e.g., total coins), or you can set up

multiple scenarios.

Sample Solution:

- For example, if $z=4$ (20p), then:
- $x + 2y = 10$
- Possible combinations can be explored.

Educational Focus:

- Working with linear equations and integer solutions.
- Understanding value combinations.

- The Calendar Problem

Puzzle: If January 1st is a Monday, what day of the week will January 1st be on after 100 days?

Solution:

- 100 days after January 1:
- Divide 100 by 7 (days in a week): $100 / 7 = 14$ weeks and 2 days.
- So, after 14 weeks, it's still Monday.
- Add the remaining 2 days:
- Monday + 2 days = Wednesday.

Answer: The next January 1st will be on a Wednesday.

Educational Focus:

- Understanding modular arithmetic.
- Applying division and remainders.

- The Pattern Puzzle

Puzzle: Find the next number in the sequence: 2, 4, 8, 16, __ ?

Solution:

- Recognize the pattern: each number doubles.
- Next number: $16 \times 2 = 32$.

Answer: 32.

Educational Focus:

- Recognizing geometric sequences.
- Extending patterns logically.

Question What is the answer to this puzzle: I am a number. When you multiply me by 2 and then add 3, you get 15. What am I? Let's set the number as x . The equation is $2x + 3 = 15$. Subtract 3 from both sides: $2x = 12$. Divide both sides by 2: $x = 6$. So, the number is 6. If you have 3 apples and you buy 4 more, how many apples do you have in total? You have $3 + 4 = 7$ apples in total. What number am I? I am greater than 10, less than 20, and when you add me to 5, the total is 22. Let the number be x . The equation is $x + 5 = 22$. Subtract 5 from both sides: $x = 17$. The number is 17. A clock shows the time as 3:15. How many degrees are between the hour hand and the minute hand? At 3:15, the minute hand is at 90 degrees (quarter past the hour). The hour hand has moved a quarter of the way between 3 and 4, which is 7.5 degrees past 3. The hour hand at 3 o'clock is at 90 degrees, so at 3:15, it is at 97.5 degrees. The difference is $97.5 - 90 = 7.5$ degrees. If a rectangle has a length of 8 cm and a width of 3 cm, what is its area? The area of the rectangle is $\text{length} \times \text{width} = 8 \text{ cm} \times 3 \text{ cm} = 24$ square centimeters.
