Fundamentally, the elements of photogrammetry can be categorized into three broad domains:

- Data acquisition
- Data processing
- Data interpretation and analysis

Each domain encompasses critical elements that collectively define the integrity and usefulness of the photogrammetric output.

Core Elements of Photogrammetry

1. Image Acquisition

The foundation of any photogrammetric project is high-quality photographic data. Proper image acquisition ensures that subsequent processing yields accurate and detailed results.

Key aspects include:

- Sensor and Camera Selection:

Digital cameras, whether consumer-grade or specialized metric cameras, are chosen based on resolution, lens quality, and calibration requirements. Metric cameras with known internal parameters facilitate precise measurements.

- Overlap and Coverage:

Adequate forward and side overlaps are vital. Typically, 60-80% overlap in the flight path or shooting grid ensures sufficient data redundancy. For dense point cloud generation, higher overlap improves point matching.

- Camera Calibration:

Determining intrinsic parameters (focal length, principal point, distortion coefficients) is essential for correcting lens distortions and ensuring measurement accuracy.
