### Example

```
```matlab
```

```
% Define nodes
```

```
nodes = 1:5;
```

```
% Define links with costs
```

```
edges = [1 2 2;
```

```
2 3 1;
```

```
3 4 3;
```

```
4 5 1;  
  
1 5 4];  
  
% Create directed graph  
  
G = digraph(edges(:,1), edges(:,2), edges(:,3));  
  
plot(G,'EdgeLabel',G.Edges.Weight)  
  
title('Network Topology')  
  
...
```

This code constructs a simple directed network graph with weighted edges, serving as the basis for routing protocol simulation.

Implementing Routing Algorithms in MATLAB

Once the network topology is modeled, the next step involves implementing routing algorithms. These algorithms determine how routers update and maintain routing tables based on protocol-specific rules.

Common Routing Protocol Algorithms

- Distance Vector Protocols (e.g., RIP): Routers share their routing tables with neighbors periodically, updating their own based on received information.
- Link State Protocols (e.g., OSPF): Routers share information about their directly connected links, and each router independently computes the shortest path tree.
- Path Vector Protocols (e.g., BGP): Routers exchange path information to different autonomous systems, considering policies and path attributes.

MATLAB Implementation Approach

- Data Structures: Use matrices or cell arrays to store routing tables, metrics, and path information.
- Message Passing Simulation: Model the exchange of routing updates via function calls, message queues, or simulated time steps.
- Convergence Logic: Implement iterative algorithms where routers update their tables until

stability is achieved.

Example: Simple Distance Vector Algorithm

```
```matlab
```

```
% Initialize routing tables
```

```
numNodes = 5;
```

```
maxHops = 10;
```

```
distanceTable = inf(numNodes, numNodes);
```

```
for i=1:numNodes
```

```
distanceTable(i,i) = 0;
```

```
end
```

```
% Define initial link costs (adjacency)
```

```
linkCosts = [0 2 inf inf 4;
```

```
2 0 1 inf inf;
```

```
inf 1 0 3 inf;
```

```
inf inf 3 0 1;
```

```
4 inf inf 1 0];
```

```
% Simulate distance vector updates
```

```
for hop=1:maxHops
```

```
updated = false;
```

```
for i=1:numNodes
```

```
for j=1:numNodes
```

```
for k=1:numNodes

if linkCosts(i,k) + distanceTable(k,j)
distanceTable(i,j) = linkCosts(i,k) + distanceTable(k,j);

updated = true;

end

end

end

end

if ~updated

break; % Convergence reached

end

end

disp('Final Distance Table:')

disp(distanceTable)

...
```

This simplified example demonstrates how MATLAB can be used to emulate the iterative nature of distance vector routing.

## Simulation of Protocol Dynamics and Performance Evaluation

Simulation is not limited to routing table calculation; it extends to analyzing protocol behavior over time, under different network conditions, and measuring performance metrics such as convergence time, routing loops, scalability, and robustness.

plot(iterations, convergenceMetric)

xlabel('Iteration')

ylabel('Route Stability Metric')

title('Routing Protocol Convergence')

```
```
