This comprehensive coverage equips students with the tools necessary to solve complex problems involving circles, both algebraically and geometrically.

Key Concepts and Theorems in Chapter 10

1. Circles and Their Properties

A circle is the set of all points equidistant from a fixed point called the center. Understanding the basic properties of a circle is fundamental:

- The radius is the distance from the center to any point on the circle.
- The diameter is twice the radius and passes through the center.
- The circumference is the perimeter of the circle, calculated as $C = 2\pi r$.

2. Chords, Secants, and Tangents

- Chord: A segment with both endpoints on the circle.
- Secant: A line that intersects the circle at two points.
- Tangent: A line that touches the circle at exactly one point.

Key properties include:

- The perpendicularity of the radius to the tangent at the point of contact.
- The relationship between chords and their distances from the center.

3. Inscribed and Central Angles

- Central angle: An angle with its vertex at the circle's center, intercepting an arc.
- Inscribed angle: An angle with its vertex on the circle, intercepting an arc.

Significant theorems:

- The measure of a central angle equals the measure of its intercepted arc.
- The measure of an inscribed angle is half the measure of its intercepted arc.

4. Arcs and Their Measures

- Major and minor arcs: Parts of the circle between two points, with measures greater than 180° or less.
- The measure of an arc is equal to the measure of its intercepted central angle (for minor arcs).

5. Theorems Related to Circles

- Theorem 10.1: The measure of an inscribed angle is half the measure of its intercepted arc.
- Theorem 10.2: If two chords intersect inside a circle, the products of the segments they form are equal.
- Theorem 10.3: Tangent segments from a common external point are congruent.
- Theorem 10.4: The angles formed outside a circle by two secants are related to the intercepted arcs.
