What are some common challenges in simulation modeling identified by Law and Kelton, and how can they be addressed? Challenges include model complexity, data quality, validation, and computational resources. Law and Kelton suggest addressing these by simplifying models where possible, ensuring accurate data collection, rigorous validation procedures, and leveraging advanced computing tools. How does Law and Kelton recommend validating and verifying simulation models to ensure reliability? They recommend a combination of verification (checking that the model is implemented correctly) and validation (ensuring the model accurately represents the real system). Techniques include debugging, sensitivity analysis, comparing model outputs with real data, and conducting statistical tests to confirm model fidelity.
